### Layered unit cell

The program requires *a priori* identification of layers within the unit cell. These should be loaded into the program as a csv file of the following format, where each cell represents a csv entry:

Layer	Atom	Element	x	y	z	Occupancy
A	Sc1	Sc <sup>3+</sup>	0	0	0	1
A	Li1	Li <sup>+</sup>	0	0.3347	0	1
A	Li2	Li <sup>+</sup>	0.5	0.169	0	0.365
B	Sc1	Sc <sup>3+</sup>	0	0.5	0.5	1
B	Li1	Li <sup>+</sup>	0	0.1653	0.5	1
B	Li2	Li <sup>+</sup>	0	0.331	0.5	0.365

**Layer** is a unique tag associated with a given layer of atoms. **Atom** is a unique tag to distinguish from other atoms of the same type. **Element** is the atomic element and oxidation state. The parameters **x**, **y**, and **z** are the atomic position in fractional coordinates. **Occupancy** is the site occupancy.

**Note:** Unit cell should be transformed (if necessary) such that layers are orthogonal to lattice vectors. When importing the csv, the stacking direction will automatically be converted to c.

**Supercell size (N)** – Number of repeat unit cells used to construct supercells

**Stacking direction** – Lattice vector orthogonal to layers

**Faulted layer** – Unique tag of layer to be faulted

**Stacking probability (P)** – Probability with which faulting will occur in a given layer

**Stacking vector (S)** – Translation vector corresponding to stacking fault displacement in fractional coordinates relative to the original layer position

# Package API

---

## pyfaults

Top-level module.

### Functions

`toCif (cell, path, fn, inclPkl=False)`

Generates a CIF file from a given structure.

<b>Parameters</b>	<code>cell</code> ( <i>Unitcell or Supercell</i> ) – Structure to write to cif format <code>path</code> ( <i>str</i> ) – File directory to save to <code>fn</code> ( <i>str</i> ) – File name to save to <code>inclPkl</code> ( <i>bool, optional</i> ) – Generates pickle file of cif data. Default is False.
<b>Returns</b>	None

`importCSV (path, fn)`

Imports CSV file as a dataframe.

<b>Parameters</b>	<code>path</code> ( <i>str</i> ) – File directory <code>fn</code> ( <i>str</i> ) – File name
<b>Returns</b>	None

### Classes

**Lattice**

Lattice parameters

**LayerAtom**

Atom in a specified layer and its properties

**Layer**

Collection of atoms that form a specified layer

**ChildLayer**

Spatially translated child layer from parent layer

**Unitcell**

Collection of layers that form a unit cell

**Supercell**

Collection of unit cells that form a supercell

## pyfaults.lattice

Contains class Lattice for defining lattice parameters.

`class Lattice (a, b, c, alpha, beta, gamma)`

Bases: `object`

Stores lattice parameter values.

<b>Parameters</b>	<code>a</code> ( <i>float</i> ) – Lattice vector a (Å) <code>b</code> ( <i>float</i> ) – Lattice vector b (Å) <code>c</code> ( <i>float</i> ) – Lattice vector c (Å) <code>alpha</code> ( <i>float</i> ) – Lattice angle $\alpha$ (°) <code>beta</code> ( <i>float</i> ) – Lattice angle $\beta$ (°) <code>gamma</code> ( <i>float</i> ) – Lattice angle $\gamma$ (°)
-------------------	--

### Functions

`setParam (a=None, b=None, c=None, alpha=None, beta=None, gamma=None)`

Sets one or more lattice parameters, any parameters not specified will retain original values.

<b>Parameters</b>	a ( <i>float, optional</i> ) – New value of lattice vector a (Å) b ( <i>float, optional</i> ) – New value of lattice vector b (Å) c ( <i>float, optional</i> ) – New value of lattice vector c (Å) alpha ( <i>float, optional</i> ) – New value of lattice angle $\alpha$ (°) beta ( <i>float, optional</i> ) – New value of lattice angle $\beta$ (°) gamma ( <i>float, optional</i> ) – New value of lattice angle $\gamma$ (°)
<b>Returns</b>	<i>Self</i>

display ()

Prints lattice parameters.

<b>Parameters</b>	None
<b>Returns</b>	None

## pyfaults.layerAtom

Contains class LayerAtom for defining atoms in specific layers.

*class LayerAtom (layerName, atomLabel, element, xyz, occupancy, lattice)*

Bases: object

Stores layer-specific atomic properties.

<b>Parameters</b>	layerName ( <i>str</i> ) – Unique identifier for layer in which atom is located atomLabel ( <i>str</i> ) – Unique identifier for atom element ( <i>str</i> ) – Atomic element and oxidation state (if applicable) xyz ( <i>narray</i> ) – Atomic position [x, y, z] in fractional coordinates occupancy ( <i>float</i> ) – Crystallographic site occupancy lattice ( <i>Lattice</i> ) – Unit cell lattice parameters
-------------------	---

### Functions

*setParam (layerName=None, atomLabel=None, element=None, xyz=None, lattice=None, occupancy=None)*

Sets one or more atomic parameters, any parameters not specified will retain original values.

<b>Parameters</b>	layerName ( <i>str, optional</i> ) – New layer name atomLabel ( <i>str, optional</i> ) – New atom label element ( <i>str, optional</i> ) – New element label xyz ( <i>narray, optional</i> ) – New array for atomic position occupancy ( <i>float, optional</i> ) – New value for site occupancy lattice ( <i>Lattice, optional</i> ) – New unit cell lattice
<b>Returns</b>	<i>Self</i>

display ()

Prints atomic parameters.

<b>Parameters</b>	None
<b>Returns</b>	None

## pyfaults.layer

Contains class Layer for storing a list of atoms that defines a layer.

*class Layer (atoms, lattice, layerName)*

Bases: `object`

Collection of atoms that form a layer.

<b>Parameters</b>	atoms ( <i>LayerAtom</i> ) – List of LayerAtom instances to add to layer lattice ( <i>Lattice</i> ) – Unit cell lattice parameters layerName ( <i>str</i> ) – Unique identifier for layer
-------------------	---

### Functions

*setParam (atoms=None, lattice=None, layerName=None)*

Sets one or more layer parameters, any parameters not specified will retain original values.

<b>Parameters</b>	atoms ( <i>LayerAtom, optional</i> ) – New list of atoms to add to layer lattice ( <i>Lattice, optional</i> ) – New unit cell lattice layerName ( <i>str, optional</i> ) – New layer name
<b>Returns</b>	<i>Self</i>

*display ()*

Prints layer name and atoms.

<b>Parameters</b>	None
<b>Returns</b>	None

*atom.info ()*

Prints atomic information of atoms in layer.

<b>Parameters</b>	None
<b>Returns</b>	None

### Additional Methods

*getLayers (df, lattice, layerNames, stackDir)*

Pulls layer information from imported dataframe.

<b>Parameters</b>	df ( <i>dataframe</i> ) – Dataframe with atomic parameters lattice ( <i>Lattice</i> ) – Unit cell lattice parameters layerNames ( <i>str</i> ) – Layer names as documented in imported csv stackDir ( <i>str</i> ) – Lattice vector orthogonal to layers
<b>Returns</b>	layers ( <i>Layer</i> ) – List of layer instances

## pyfaults.childLayer

Contains class ChildLayer for generating a spatially translated copy of a parent layer.

*class ChildLayer (layerName, parent, transVec)*

Bases: `object`

Generates a child layer from a given parent layer.

<b>Parameters</b>	layerName ( <i>str</i> ) – Unique identifier for child layer parent ( <i>Layer</i> ) – Parent layer transVec ( <i>nparray</i> ) – Translation vector [x, y, z] representing shift from parent layer position to child layer position in fractional coordinates
-------------------	--

### Functions

*setParam (layerName=None, parent=None, transVec=None)*

Sets one or more child layer parameters, any parameters not specified will retain original values.

<b>Parameters</b>	layerName ( <i>str, optional</i> ) – New child layer name parent ( <i>Layer, optional</i> ) – New parent layer transVec ( <i>nparray, optional</i> ) – New translation vector
<b>Returns</b>	<i>Self</i>

**generate** (*parent, transVec*)

Creates child layer by translating parent layer.

<b>Parameters</b>	parent ( <i>Layer</i> ) – Parent layer transVec ( <i>nparray</i> ) – Translation vector [x, y, z] representing shift from parent layer position to child layer position in fractional coordinates
<b>Returns</b>	<i>Self</i>

**display** ()

Prints layer name and atoms.

<b>Parameters</b>	None
<b>Returns</b>	None

**atom.info** ()

Prints atomic information of atoms in layer.

<b>Parameters</b>	None
<b>Returns</b>	None

## pyfaults.unitcell

Contains class Unitcell for storing a list of layers that defines a unit cell.

*class* Unitcell (*name, layers, lattice*)

Bases: object

Collection of layers that form a unit cell.

<b>Parameters</b>	name ( <i>str</i> ) – Unique identifier for unit cell layers ( <i>Layer</i> ) – List of layers that form unit cell lattice ( <i>Lattice</i> ) – Unit cell lattice parameters
-------------------	--

### Functions

**setParam** (*name=None, layers=None, lattice=None*)

Sets one or more unit cell parameters, any parameters not specified will retain original values.

<b>Parameters</b>	name ( <i>str, optional</i> ) – New unit cell name layers ( <i>Layer, optional</i> ) – New list of layers lattice ( <i>Lattice, optional</i> ) – New unit cell lattice
<b>Returns</b>	<i>Self</i>

**layer.info** ()

Prints names of layers in unit cell.

<b>Parameters</b>	None
<b>Returns</b>	None

**atom.info** ()

Prints atomic information of atoms in layer.

<b>Parameters</b>	None
<b>Returns</b>	None

# pyfaults.SuperCell

Contains class SuperCell for storing a list of unit cells that defines a supercell.

*class SuperCell (unitcell, nStacks, fItLayer=None, stackVec=None, stackProb=None)*

Bases: **object**

Collection of unit cells that form a supercell.

<b>Parameters</b>	unitcell ( <i>Unitcell</i> ) – Base unit cell nStacks ( <i>int</i> ) – List of layers that form unit cell fItLayer ( <i>str, optional</i> ) – Name of faulted layer. Default is None. stackVec ( <i>nparray, optional</i> ) – Stacking vector relative to ideal position. Default is None. stackProb ( <i>float, optional</i> ) – Stacking probability. Default is None.
-------------------	--

## Functions

**setParam** (*nStacks=None*)

Sets value for number of stacks (N).

<b>Parameters</b>	nStacks ( <i>int, optional</i> ) – New N value
<b>Returns</b>	<i>Self</i>

**setLayers** (*unitcell, fItLayer=None, stackVec=None, stackProb=None*)

Sets supercell layers, if only unitcell is specified, the supercell will not be faulted.

<b>Parameters</b>	unitcell ( <i>Unitcell</i> ) – Base unit cell fItLayer ( <i>str, optional</i> ) – New name of faulted layer stackVec ( <i>nparray, optional</i> ) – New stacking vector stackProb ( <i>float, optional</i> ) – New stacking probability
<b>Returns</b>	<i>Self</i>

**layer\_info** ()

Prints names of layers in unit cell.

<b>Parameters</b>	None
<b>Returns</b>	None

**show\_faults** ()

Prints names of faulted layers.

<b>Parameters</b>	None
<b>Returns</b>	None
